Important: End of support of deprecated access and refresh tokens endpoints

In march 2021 we announced that we were deprecating our access and refresh token endpoint. On February 8th 2022 those deprecated services will be shut down. Most of our partners already moved to the new endpoint, if that's not the case for your integration please review the article below to get more information on the breaking change.

[REVIEW THE CHANGE](#)

Developer portal major update

We're working every day to improve our documentation. This new major version was built to provide integration guides for our main integration use cases.

TRY IT NOW!

Public API - Sleep `WASO` property update:

Starting January 18th, the `WASO` property will now take into account both awake time while lying in bed as well as phases where the user is out of bed. So far, this property only took into account awake time while in bed. This update will enable our `WASO` property to match its definition in the sleep literature.

Logistic API update - better handling of replacement orders:

Starting January 18th, for replacement orders, the order update notifications will now include an `is_replacement` boolean property as well as an `original_customer_ref` property, which will make finding the initial order easier for our partners.
